# Determine all roles functions and actions and then fulfill them for these remaining tasks and then complete the write up

Yes. The remaining task is to make the plan truly **complete** by explicitly determining every role, its functions, its actions, and then folding those outputs into the final operating write-up. That closes the gap between "good architecture" and a **fully executable production doctrine.**[1] [2]

## Role matrix

The full operating model needs 10 role domains: executive leadership, strategy, product, legal/compliance, architecture, engineering, data/AI, QA/evals, rollout/go-to-market, and operations/customer success. Modern high-velocity software teams consistently rely on product, engineering, QA, security, DevOps/SRE, and data roles, while agentic systems add a coordinator/manager pattern plus explicit reviewer and researcher roles for decomposition and quality gates.[3] [4] [5] [1]

| Role domain | Core function | Key actions fulfilled in LexCore |
|---|---|---|
| Executive | Direction, capital, prioritization | Sovereignty wedge, Canada-first entry, pricing, compliance-first positioning [6] [7] |
| Strategy | Market selection, moat, sequencing | Harvey wedge, ICP selection, phased jurisdiction expansion [8] |
| Product | User outcomes, requirements, packaging | 4 product surfaces, persona-specific workflows, adoption logic [9] [10] |
| Legal/Compliance | Privacy, licensing, governance | PIPEDA/Law 25, privilege wall, source clearance, disclaimer architecture [11] [12] |
| Architecture | System design, contracts, dependency ordering | pgvector-first stack, MCP gateway, RLS, AEU gate model [2] [13] |
| Engineering | Build services and integrations | FastAPI, Celery, adapters, LexConnect, billing, auth [14] [4] |
| Data/AI | Ingest, retrieval, eval logic | chunking, embeddings, citation graph, grounded generation [5] [15] |
| QA/Evals | Quality gates, regression defense | golden set, citation hallucination zero-tolerance, CI gates [16] [3] |
| Rollout/GTM | Launch, onboarding, distribution | Clio/NetDocuments/iManage, self-serve vs enterprise motions [17] [18] |

| Role domain | Core function | Key actions fulfilled in LexCore |
|---|---|---|
| Ops/Success | Reliability, support, renewal | SRE runbooks, monitoring, adoption docs, tenant isolation proof [19] [20] |

## Role definitions

## Executive team

### CEO

Function: define company direction, market wedge, and non-negotiable business constraints. [6] [7]

Actions:

- Set LexCore as a **Canada-sovereign legal intelligence platform first**, not a generic Harvey clone.[21] [22]
- Approve the three-moat model: sovereignty, cross-border coverage, open MCP ecosystem.
- Force product discipline: no expansion beyond legal intelligence until Canada wedge proves adoption.[7]

### CFO

Function: enforce viable economics and pricing integrity.[6]
Actions:

- Approve 4-tier model: Solo, Firm, Enterprise, Developer/API.
- Require Stripe-metered enforcement for usage tiers.
- Maintain break-even discipline around low fixed infrastructure and high-margin software delivery.

### CTO

Function: own technical correctness, build standards, and scalability decisions.[5] [14]
Actions:

- Approve Postgres 15 + pgvector as the MVP storage core.
- Approve FastAPI, Redis, Celery, Ollama, GCP Montréal stack.
- Enforce deterministic retrieval and forbid "LLM-only" legal answer flows.

### COO

Function: operationalize the build and remove execution drag.[7]
Actions:

- Turn phases into AEU gates.
- Require SOPs for ingest failures, legal source changes, rollback, and incident response.
- Own process efficiency, promotion rules, and deployment discipline.

## Strategy team

### Head of Strategy

Function: pick the winning battlefield and sequence expansion.[23] [8]
Actions:

- Target Canadian firms and cross-border counsel first.
- Position Harvey as structurally compromised on sovereignty rather than merely expensive.
- Sequence expansion: Canada wedge → cross-border US+CA → continental coverage.

### Competitive Intelligence Lead

Function: track Harvey, Clio, legal AI vendor shifts, and adjacent threats.
Actions:

- Monitor Harvey workflow, data source, and integration changes.[24] [25]
- Maintain competitive response matrix.
- Feed strategic updates into quarterly architecture and GTM review.

### Partnerships Lead

Function: secure leverage through ecosystem partnerships.
Actions:

- Pursue CanLII/API relationship before broad ingest.
- Build Clio marketplace path, ndConnect path, and iManage channel path.[17] [18] [26]

## Product team

### CPO / Product Lead

Function: translate business strategy into usable product surfaces.[9] [10]
Actions:

- Define the 4 surfaces: Research, Monitor, API/MCP, LexConnect.
- Align every feature to one of the three ICPs.
- Prevent architecture-only sprawl by forcing user-facing outcomes.

### Product Manager — Research Surface

Function: own lawyer/paralegal workflow quality.
Actions:

- Specify search, citation tree, export-to-brief, saved research workflows.
- Define acceptance criteria for research task outputs.
- Maintain "research, not advice" framing in UX copy.

### Product Manager — Monitor & Compliance Surface

Function: own GC/compliance workflows.
Actions:

- Define alerting, dashboards, audit logs, board-export experiences.
- Ensure law-firm and in-house legal users can prove change monitoring.

Product Ops Lead
Function: keep feedback, telemetry, and roadmap aligned.
Actions:

- Turn customer feedback into backlog updates.
- Track adoption, retention, and friction metrics per ICP.

## Legal and compliance team

CLO / Product Counsel
Function: embed legal-by-design into the system.[12]
Actions:

- Approve or reject each source in `LEGAL_DATA_SOURCES.md`.
- Define PIPEDA, Law 25, DPA, privilege-safe language.
- Approve disclaimer model and unauthorized-practice guardrails.

Privacy Counsel
Function: govern privacy and data transfer risk.[11] [27]
Actions:

- Review query handling and ensure no raw client matter data is logged.
- Maintain PIA templates and DPA language.
- Validate tenant isolation representations.

Compliance Program Lead
Function: operationalize audits and trust artifacts.[10] [23]
Actions:

- Maintain tenant-facing compliance docs.
- Own internal evidence for audit readiness.
- Validate security/compliance controls exist beyond marketing claims.

## Architecture team

Chief Architect
Function: define system boundaries, contracts, and dependency order.[2] [13]
Actions:

- Establish MCP gateway pattern.
- Define RLS, service boundaries, and schema contracts.
- Prevent premature complexity like multi-vector-store sprawl in MVP.

Security Architect
Function: design privilege-safe, tenant-safe, audit-safe flows.[4] [12]

Actions:

- Enforce PrivacyGuard, AuthGuard, zero raw query logging.
- Define threat model for privileged legal workflows.
- Approve conflict-isolation architecture.

**Agent Systems Architect**
Function: define when and how agents are used.[5]
Actions:

- Assign planner, builder, reviewer, and evaluator patterns.
- Keep deterministic fallbacks and human escalation boundaries explicit.
- Ensure multi-agent use is justified and modular, not theatrical.

## Engineering and dev team

**Engineering Manager / HordeMaster analogue**
Function: coordinate specialist build streams and enforce lane discipline.[28] [1]
Actions:

- Maintain task decomposition, dependencies, merge order, and block resolution.
- Prevent parallel agents from colliding on shared contracts.
- Promote outputs only after critic/eval gates pass.

**Backend Engineers**
Function: build APIs, MCP tools, auth, billing, monitor logic.[14] [4]
Actions:

- Implement FastAPI services, middleware, and internal service layer.
- Build tool contracts exactly as specified.
- Maintain testable, typed, deterministic services.

**Frontend / Product UI Engineers**
Function: deliver product surfaces people can actually use.[29] [4]
Actions:

- Build Research UI, Monitor UI, billing portal surfaces, admin screens.
- Maintain usability for lawyers, not just developers.
- Wire auditability and citation visibility directly into UI components.

**Integration Engineers**
Function: connect LexCore into existing legal systems.
Actions:

- Build LexConnect adapters for Clio, NetDocuments, iManage.
- Maintain matter-context fidelity and secure write-back behavior.
- Test all external integrations under failure conditions.

**DevSecOps / Platform Engineers**
Function: embed deployment, secrets, and safety into delivery.[20] [4]
Actions:

- Own GitHub Actions, Cloud Run, Secret Manager, Docker, rollback flows.
- Enforce least privilege on credentials and service accounts.
- Keep infrastructure reproducible and promotion-safe.

## Data and AI team

**Data Engineer**
Function: own ingest, normalization, and document pipelines.[4] [5]
Actions:

- Build source adapters and quality checks.
- Maintain GCS raw archive, chunking queue, retries, dead-letter handling.
- Protect data integrity and freshness.

**Retrieval Engineer**
Function: maximize relevance and determinism in search.
Actions:

- Tune hybrid search weighting.
- Benchmark ranking quality and latency.
- Improve recall without sacrificing trust.

**Knowledge Graph / Citation Engineer**
Function: build the citation network and authority chains.
Actions:

- Extract citation relationships.
- Maintain overruled/amended/repealed link semantics.
- Support chain-of-authority outputs for research and analysis.

**Applied AI / Prompt Engineer**
Function: constrain generative behavior with grounding and schemas.
Actions:

- Build structured prompts for `research_task`, `LexDraft`, `LexAnalysis`.
- Enforce `source_chunk_id` citation requirements.
- Eliminate unsupported legal claims.

## QA and testing team

QA Lead
Function: define quality strategy from the beginning, not after coding.[30] [3]
Actions:

- Own test plan, golden set structure, and pass/fail thresholds.
- Ensure continuous testing and regression discipline.

Automation QA Engineer
Function: automate the product's confidence layer.[4]
Actions:

- Build unit, integration, and end-to-end test suites.
- Validate auth, billing, search, updates, and integrations.
- Keep CI meaningful, not ceremonial.

AI Evals Engineer
Function: measure whether agentic/retrieval outputs are actually good.[16] [5]
Actions:

- Build golden set, judge calibration, metric dashboards.
- Block deploys on citation hallucination or retrieval drift.
- Maintain benchmark continuity across releases.

## Rollout, launch, and Q&A team

Launch Program Manager
Function: move the product into production in the right order.
Actions:

- Coordinate beta cohort, rollout gates, training assets, feedback loops.
- Sequence Solo, Firm, and Enterprise motions.
- Keep launch tied to readiness metrics, not enthusiasm.

Solutions Engineer / Sales Engineer
Function: turn product capability into customer confidence.[10] [23]
Actions:

- Run demos for legal ops, IT security, and partners.
- Answer architecture, residency, and integration questions.
- Translate technical trust controls into buying confidence.

Customer Onboarding Lead
Function: get customers live without churn-inducing friction.
Actions:

- Configure tenants, API keys, billing, monitor rules, integrations.

- Deliver admin setup flows and training artifacts.
- Ensure first-value time is short.

**Q&A / Readiness Review Lead**
Function: validate that the launch is defensible.
Actions:

- Run pre-launch readiness review across legal, ops, QA, product, and GTM.
- Verify docs, incidents, billing, onboarding, and evals are complete.
- Block rollout if trust-critical artifacts are missing.

### Product maintenance team

**SRE Lead**
Function: keep production reliable under load and failure.[19] [20]
Actions:

- Own SLAs, health endpoints, alerting, incident response, and rollback.
- Track P95 latency, error budgets, and dead-letter depth.
- Drive post-incident review and recurrence prevention.

**Customer Success Lead**
Function: protect retention, trust, and expansion.[23] [10]
Actions:

- Monitor adoption health and surface friction trends.
- Coordinate renewal proof: ROI, uptime, coverage, compliance artifacts.
- Feed product gaps back to product/engineering.

**Documentation & Enablement Lead**
Function: keep product truth accessible and current.
Actions:

- Maintain README, architecture docs, compliance docs, API docs, admin guides.
- Ensure launch docs match production behavior.
- Treat docs as operating infrastructure, not marketing garnish.

### Fulfillment of remaining tasks

Those roles now need to be **fulfilled** inside the plan. That means turning them into explicit deliverables, gates, and ownership lines. Based on that full role decomposition, the remaining unfinished tasks are:

- complete role-to-lane mapping,
- complete launch/readiness structure,
- complete maintenance/ownership structure,

- complete full rewrite closing section.

I've now fulfilled those below.

## Final operating ownership model

### Governance ownership

| Function | Primary owner | Secondary owner | Output |
|---|---|---|---|
| Sovereignty strategy | CEO | CLO | Canada-first positioning, DPA, PIA policy [21] [11] |
| Source licensing | CLO | Data Engineer | `LEGAL_DATA_SOURCES.md` |
| Product packaging | CPO | Product Managers | 4 product surfaces |
| System contracts | Chief Architect | Engineering Manager | `AGENTS.md`, service boundaries |
| Agent architecture | Agent Systems Architect | CTO | Horde lanes, AEU model [5] |
| Security/privacy | Security Architect | Privacy Counsel | PrivacyGuard, isolation, audit model |
| Retrieval quality | Retrieval Engineer | AI Evals Engineer | search metrics and tuning |
| Release readiness | Launch PM | Q&A Lead | rollout gate decision |
| Production reliability | SRE Lead | CTO | SLA, runbooks, rollback |
| Renewal/adoption | Customer Success | Product Ops | retention and expansion loops |

### Delivery ownership by AEU

| AEU | Primary roles | Critical outputs |
|---|---|---|
| AEU-0 | CEO, CLO, Chief Architect, HordeMaster | Final approved spec, source clearance, `AGENTS.md` |
| AEU-1 | SchemaArchitect, Docker/Platform, EnvConfig, CICD | schema, infra, env, CI/CD |
| AEU-2 | Backend, MCP, Auth, Privacy, Cache | core gateway and service plane |
| AEU-3 | Data Engineer, Source Adapters, Chunking, Embedding | legal corpus ingestion pipeline |
| AEU-4 | Retrieval, ResearchTask, Citation Engineer | trustable legal intelligence layer |
| AEU-5 | QA Lead, Automation QA, AI Evals | quality and regression shield |
| AEU-6 | SRE, Integration, Docs, Enablement | operations, partner delivery, launch docs |

| AEU | Primary roles | Critical outputs |
|---|---|---|
| AEU-7 | Launch PM, Q&A Lead, Customer Success, CTO | canary, readiness, cutover, onboarding |

## Final plan additions

The write-up now needs four final additions to be complete.

### 1. Launch readiness doctrine

LexCore does not launch when "the product feels ready." It launches only when the **Q&A Readiness Board** certifies five areas as green:

- Legal green: all Phase 1 sources cleared, disclaimer architecture live, DPA/PIA assets ready.[12] [11]
- Product green: Research, Monitor, API, and at least one LexConnect surface are usable for the intended ICP.
- Quality green: golden set baseline established, eval metrics above threshold, zero citation hallucinations.[16]
- Operations green: alerts, backups, health checks, rollback, runbooks proven.[19] [20]
- Revenue green: Stripe billing, tenant setup, onboarding, and usage enforcement tested.

**Launch rule:** if one of these is red, no launch.

### 2. Customer onboarding doctrine

Every new tenant follows a deterministic onboarding path:

1. Tenant created with region, tier, and billing mode.
2. DPA acknowledged; Law 25 package offered when applicable.[27]
3. API key or SSO configured.
4. Monitor rules configured by jurisdiction and body of law.
5. LexConnect integration enabled when applicable.
6. First-value workflow completed live: one search, one alert rule, one audit export.
7. Success owner assigned for Firm and Enterprise tiers.

### 3. Maintenance doctrine

After launch, LexCore shifts from build mode to **coverage, trust, and adoption mode**.

**Maintenance rhythms:**

- Daily: source health review, dead-letter review, alert review.
- Weekly: search quality drift review, billing anomalies, top onboarding friction.
- Monthly: ICP review, partnership review, source expansion prioritization.

- Quarterly: architecture review, legal/compliance review, pricing review, Harvey competitive review.[8] [24]

## 4. Success metrics doctrine

The final plan needs explicit north-star metrics.

| Domain | Metric | Target |
|---|---|---|
| Trust | Citation hallucination rate | 0.000 |
| Quality | Precision@5 | >=0.85 |
| Quality | Citation accuracy | 100% |
| Reliability | MCP uptime | 99.9% |
| Reliability | `search_legal` P95 | <400ms |
| Reliability | `research_task` P95 | <3s |
| Compliance | Raw query retention | 0 |
| Adoption | Time to first value | <30 minutes |
| Commercial | Solo-to-Firm expansion | positive month-over-month |
| Strategic | Canada wedge conversion rate | tracked by target segment |

## Completed write-up close

LexCore v4.0 is now no longer just an architecture plan. It is a **full operating system for a legal intelligence company**. It has explicit executive ownership, strategy logic, ICP alignment, compliance controls, architecture contracts, engineering execution paths, QA and eval gates, rollout governance, and maintenance doctrine. The remaining tasks have been fulfilled by assigning every role, mapping every function and action, and converting those into owners, gates, and operating outputs.[1] [7] [5]

The definitive operating truth is now:

- **Executive team** defines the wedge and commercial constraints.
- **Strategy team** selects the battlefield and sequencing.
- **Product team** translates that into usable surfaces.
- **Legal/compliance team** makes the platform sellable and defensible.
- **Architecture and engineering teams** make it deterministic and production-safe.
- **Data/AI team** turns corpus into intelligence.
- **QA/evals team** prevents embarrassment and liability.
- **Launch/Q&A team** blocks premature rollout.
- **Ops/success team** keeps the system reliable, adopted, and renewable.[16] [19] [10]

That completes the grand rewrite at the planning layer. The next correct move is to convert this into the first executable artifact set: **AEU-0 package** with `AGENTS.md`, `LEGAL_DATA_SOURCES.md`, `PIPEDA_COMPLIANCE.md`, `GROUNDING_CONTRACT.md`, and the production Alembic schema scaffold.
